Woerden, May 2024

Dear SilverFit Mile client,

We're happy to present the software update for the SilverFit Mile 2025. In this letter, we explain the changes and improvements made in this software version.

1. New check for software updates

It is important to keep your Mile system up to date with the latest software updates. This ensures that the system functions optimally and gives you the best experience when using it. It might be difficult to know if your system is up to date or if there are software updates that need to be installed. For this reason, we have made it possible to check for new updates.

Check if new updates are available by following these instructions:

- Open the menu
- Click on '*Software updates*'
- Then click '*Search for updates*'. The steps that follow will guide you through installing a new update if available.

If internet access is limited or infrequent, you can also download new routes from the '*Content management*' screen, located in the menu. It's possible to make a selection of content by filtering on relevant regions and categories. There is also the option to select all content visible on the screen at that moment to be downloaded. This includes new Tour Movies, Memory Lanes and SilverFit albums. Should you only wish to download only one type of content, such as Tour Movies, this can be selected on the left side of the screen.

Once the download has been started, it's possible to see the progress of the downloads by clicking on the downloads queue. Here you can see the route currently being downloaded and the remaining routes in the queue.

2. Improved route creation using Google Street View

For this update, we made it easier to create a route using Google Street View. You may notice the map is featured bigger on the screen than previously. This is to make clicking on the map easier to add waypoints to interesting places. It is also easy to connect the addresses to points on the map, as the pins are now numbered.

In addition, it is now possible to create routes in more places as Google Street view will use walking and cycling paths as well as driving roads to create a route.

3. Improvements to User content

3.1 Support for more video formats for User content

Based on your feedback, we have expanded the range of video formats supported for User content. This means that the most frequently used video formats will be recognized when uploading videos to the Mile. You can upload and play your own content on the Mile by going to the 'User content' tab. Please let us know if any issues occur!

3.2 Correct presentation of images in portrait orientation

Images in portrait orientation will automatically be presented correctly for optimal viewing pleasure.

Suggestions or ideas?
We are already working on our next update with new features. If you have suggestions or ideas for the SilverFit Mile, please let us know by emailing mile@silverfit.nl

Best regards,

Team SilverFit
